Foreword

Our universe Milky Way Galaxy produced the Solar System, the Solar System produced the Earth. In my viewpoint, The nature is composed by the majority of Cold Quantum and the minority of Hot Quantum, the combination of Cold Quantum and the Hot Quantum forms the material, the aggregation of the material forms celestial bodies, Cold Quantum pushes the movement of celestial bodies, please watch my web: www.coldpressure.com.cn, my web can explain this for you. Today, I'd like to say some thing about how the Milky Way Galaxy is producing fixed star unceasingly, how fixed star is producing the planet such as the Earth, and how the fixed star and planets are disappearing unceasingly.

Key word: The Cold Quantum Pressure, the Hot Quantum Pressure, Electron Subgroup, the Produce of the Fixed Star, the produce of the planet, the Circulation of Galaxy.

The Milky Way Galaxy is a big whirlpool galaxy composed by many fixed stars, the Milky Way Galaxy is composed by many ancient fixed stars, originally these stars were just like iridescent cloud as we see nowadays clouds stacking layer upon layer in the sky, and under the encircle pressure of Cold Quantum, finally they have been pressed into many fixed stars. The Cold Quantum of outer space flows into the Milky Way Galaxy, encircles and pushes the movement of the Milky Way Galaxy. The Hot Quantum released by the fixed stars of the Milky Way Galaxy bars the fixed stars to be pressed into together by Cold Quantum, so fixed star can keep a distance from the pushes of the Hot Quantum. The most of the calorescence energy released by the fixed stars of the Milky Way Galaxy forms many electrons under unceasingly encircle of the Cold Quantum, Cold Quantum can cut calorescence energy, small swirl-pool formed by surrounding photons is electron. The light of electron are turned back by Cold Quantum, we can't see it, so we can only see electron. Therefore, there are many electrons are producing in the Milky Way Galaxy unceasingly. At the

same time, the Cold Quantum pressing into the Milky Way Galaxy is pushing electrons into the Empty in the middle of the Milky Way Galaxy unceasingly.

Empty's formation of central Milky Way Galaxy, because the density of fixed star in the central Milky Way Galaxy is very large, so heat pressure it produces is also large, Heat thrust produces between them pushes the fixed star away from the Milky Way Galaxy, thus a very big Empty is produced in this way. And then the Empty begins to exist for a long time. The electrons produce unceasingly in the Milky Way Galaxy then are pressed into this big Empty unceasingly. More and more electrons produced in the central Milky Way Galaxy, finally they form into electron subgroup, unceasing accumulation of electrons enable the pressure increases unceasingly and when pressure reaches the critical point, an explosion breaks out in the electron subgroup. The electrons are all extruded, the outside Cold Quantum of electron is crushed, they have been crushed into outside of electron subgroup, heat inside the electron has been crushed into many big heat and light subgroup, photon of the heat and light subgroup have been compressed into neutron subgroup. These heat and light subgroup is fixed star. Fixed star bears from the empty of the Milky Way Galaxy in this way. The uninterrupted phenomena formation of the fixed star has lasted for several millenniums or tens thousands years even hundreds million years. Heat pressure produces in the middle of The Milky Way Galaxy pushes each other, they push these new fixed star away from middle of the Milky Way Galaxy, along with the outward movement of old fixed star, due to the extrusion of movement, the old fixed star also are forced to move outward, thus, the center of the Milky Way Galaxy again become an empty. The fixed star in the middle of the Milky Way Galaxy are pushing away by the heat pressure to the outside of the Milky Way Galaxy. In this way, the short distance fixed star is pressed into the outside of the Milky Way Galaxy, their space distance is larger, due to the distance is larger and density becomes thinner. Cold quantum is pressing into every fixed star and push them rotation.

The material formed by the collision between Cold Quantum and the surface of the fixed star is called as nuclear fusion. Material is forming in this way in the surface of the fixed star. When more material produces in the surface of the fixed star and accumulated in the surface of it, they can turn back the heat pressure of the fixed star, at this time, the fixed star is no longer to glow. Then, downward pressure formed in the surface of the fixed star and the heat pressure formed by the inside thermonuclear reaction of the fixed star reaches the critical point, they will burst into an explosion in the surface of the fixed star. Heat Quantum burst out from the fixed star, exploded

material shivers of the fixed star is crushing into the space around the fixed star. Some of this shivers conglutinate together and formed into a fixed star. During cooling time of the fixed star, some of the surface material is chemical combined into new material, such as silicon oxide, water etc., and some of organic compound is chemical combined into life-form. The planetary system produces in the fixed star detonation is called the supernova eruption. When the new fixed star moved towards the flank from the middle, many fixed stars have a supernova eruption in this sector, the fixed star is reemitting the light and the heat by now, when the fixed star has arrived nearby Milky Way Galaxy flank, almost all the fixed stars have its own planet, some planets have the suitable temperature, have the water also have the life. Our Sun along with the Earth existing in the outer space of The Milky Way Galaxy in this way. The Sun is an old fixed star, the fixed stars in the middle of the Milky Way Galaxy are the new fixed stars, and the fixed stars between the new fixed star and old star of the Sun are middle-aged fixed stars.

The formation and rotation of the Milky Way Galaxy's whirlpool is formed under the outside cold quantum pressure. This cold quantum pressure is the dark material, that's the ether what I said before. Heat pressure emitted by the inside fixed star of the Milky Way Galaxy pushes the fixed star moving away from the middle of the Milky Way Galaxy, it leaves space for the new formed fixed star. Heat Quantum pushing fixed star away is the dark energy. There are new fixed star born unceasingly in the middle of the Milky Way Galaxy, heat pressure produced by the fixed stars pushes the fixed stars in the Milky Way Galaxy moving to the outside. It makes the distance of the fixed star increased, that's the reason why expansion and distance phenomena produces between the celestial bodies. When fixed star moves to the outside of the Milky Way Galaxy, that's time for ages after. The fixed star is no longer to have the calorescence energy when it has released all of its energy. Then the size of the fixed star will reduce from big to small until fade away from outer space of Milky Way Galaxy. In the slow time of above process, the material of the fixed star is continuing in the process of disintegration, material is releasing energy unceasingly and produces the decay phenomenon, decay phenomenon is the process that heat energy of nucleus smashes some of the nucleus shell of cold quantum proton, leads heat carries cold quantum departs from nucleus. Material changes from big element to small element through decay phenomenon, material changes from mass returns back to energy through decay phenomenon. The material finally vanished through the long time decay. Latter it is surrounded by Cold Quantum and is formed electron, also is delivered by the Cold Quantum pressure to the center of Milky Way Galaxy, Cold Quantum spurs the Milky Way Galaxy turns inward, while heat pushes fixed star to move outward to the Milky

Way Galaxy. The fixed star unceasingly emits the energy finally leads to vanish of itself, thermal energy emits by the fixed star is delivered to the center of the Milky Way Galaxy again by cold pressure and form a new fixed star, this is the circulation of galaxy, the circulation exists forever, Milky Way Galaxy will exist forever. Milky Way Galaxy is the universe of our system.
