## Abstract

We establish the Santilli's isomathematics based on the generalization of the modern mathematics. Isomultiplication  $a \hat{\times} b = ab\hat{T}$ , isodivision  $a \hat{\div} b = \frac{a}{b}\hat{I}$ , where  $\hat{I} \neq 1$  is called an isounit,  $\hat{T}\hat{I} = 1$ ,  $\hat{T}$  inverse of isounit. Keeping unchanged addition and subtraction,  $(+, -, \hat{\times}, \hat{\div})$  are four arithmetic operations in Santilli's isomathematics. Isoaddition  $a \hat{+} b = a + b + \hat{O}$ , isosubtraction  $a \hat{-} b = a - b - \hat{O}$  where  $\hat{O} \neq 0$  is called isozero,  $(\hat{+}, \hat{-}, \hat{\times}, \hat{\div})$  are four arithmetic operations in Santilli's new isomathematics.  $a \hat{\times} (b \hat{+} c) = a \hat{\times} (b + c + \hat{O})$ . From left side we have  $a \hat{\times} (b \hat{+} c) = a \hat{\times} b + a \hat{\times} \hat{+} + a \hat{\times} c = a \hat{\times} b + a \hat{\times} \hat{O} + a \hat{\times} c = a \hat{\times} (b + \hat{O} + c)$ , where  $\hat{+} = \hat{O}$  also is a number. **It satisfies the distributive laws.** Therefore  $\hat{+}, \hat{-}, \hat{\times}$  **and**  $\hat{\div}$  **also are numbers.** We establish Santilli's isoprime theory of the first kind, Santilli's isoprime theory of the second kind and isoprime theory in Santilli's new isomathematics.

## 1 Introduction

In 1993 Santilli [1] suggests the isomathematics based on the generalization of the multiplication  $\times$  division  $\div$  and multiplicative unit 1 in modern mathematics. It is epoch-making discovery. From modern mathematics we establish the foundations of Santilli's isomathematics and Santilli's new isomathematics. We establish Santilli's isoprime theory of both first and second kind and isoprime theory in Santilli's new isomathematics.

### (1) Division and multiplication in modern mathematics.

Suppose that

$$a \div a = a^0 = 1, \quad (1)$$

where 1 is called multiplicative unit, 0 exponential zero.

From (1) we define division  $\div$  and multiplication  $\times$

$$a \div b = \frac{a}{b}, b \neq 0, a \times b = ab, \quad (2)$$

$$a = a \times (a \div a) = a \times a^0 = a \quad (3)$$

We study multiplicative unit 1

$$a \times 1 = a, a \div 1 = a, 1 \div a = 1/a \quad (4)$$

$$(+1)^n = 1, (+1)^{a/b} = 1, (-1)^n = (-1)^n, (-1)^{a/b} = (-1)^{a/b} \quad (5)$$

The addition  $+$ , subtraction  $-$ , multiplication  $\times$  and division  $\div$  are four arithmetic operations in modern mathematics which are foundations of modern mathematics. We generalize modern mathematics to establish the foundations of Santilli's isomathematics.

### (2) Isodivision and isomultiplication in Santilli's isomathematics.

We define the isodivision  $\hat{\div}$  and isomultiplication  $\hat{\times}$  [1-5] which are generalization of division  $\div$  and multiplication  $\times$  in modern mathematics.

$$a \hat{\div} a = a^{\bar{0}} = \hat{I} \neq 1, \quad \bar{0} \neq 0, \quad (6)$$

where  $\hat{I}$  is called isounit which is generalization of multiplicative unit 1,  $\bar{0}$  exponential isozero which is generalization of exponential zero.

We have

$$a \hat{\div} b = \hat{I} \frac{a}{b}, b \neq 0, a \hat{\times} b = a \hat{T} b, \quad (7)$$

Suppose that

$$a = a \hat{\times} (a \hat{\div} a) = a \hat{\times} a^{\bar{0}} = a \hat{T} \hat{I} = a. \quad (8)$$

From (8) we have

$$\hat{T} \hat{I} = 1 \quad (9)$$

where  $\hat{T}$  is called inverse of isounit  $\hat{I}$ .

We conjectured [1-5] that (9) is true. Now we prove (9). We study isounit  $\hat{I}$

$$a \hat{\times} \hat{I} = a, a \hat{\div} \hat{I} = a, \hat{I} \hat{\div} a = a^{-\hat{I}} = \hat{I}^2 / a, \quad (10)$$

$$(+\hat{I})^{\hat{n}} = \hat{I}, (+\hat{I})^{\frac{\hat{a}}{\hat{b}}} = \hat{I}, (-\hat{I})^{\hat{n}} = (-1)^{\hat{n}} \hat{I}, (-\hat{I})^{\frac{\hat{a}}{\hat{b}}} = (-\hat{I})^{\frac{\hat{a}}{\hat{b}}} \hat{I} \quad (11)$$

Keeping unchanged addition and subtraction,  $(+, -, \hat{\times}, \hat{\div})$  are four arithmetic operations in Santilli's isomathematics, which are foundations of isomathematics. When  $\hat{I} = 1$ , it is the operations of modern mathematics.

### (3) Addition and subtraction in modern mathematics.

We define addition and subtraction

$$x = a + b, \quad y = a - b \quad (12)$$

$$a + a - a = a \quad (13)$$

$$a - a = 0 \quad (14)$$

Using above results we establish isoaddition and isosubtraction

### (4) Isoaddition and isosubtraction in Santilli's new isomathematics.

We define isoaddition  $\hat{+}$  and isosubtraction  $\hat{-}$ .

$$a \hat{+} b = a + b + c_1, \quad a \hat{-} b = a - b - c_2 \quad (15)$$

$$a = a \hat{+} a \hat{-} a = a + c_1 - c_2 = a \quad (16)$$

From (16) we have

$$c_1 = c_2 \quad (17)$$

Suppose that  $c_1 = c_2 = \hat{0}$ ,

where  $\hat{0}$  is called isozero which is generalization of addition and subtraction zero

We have

$$a \hat{+} b = a + b + \hat{0}, \quad a \hat{-} b = a - b - \hat{0} \quad (18)$$

When  $\hat{0} = 0$ , it is addition and subtraction in modern mathematics.

From above results we obtain foundations of santilli's new isomathematics

$$\begin{aligned} \hat{\times} &= \times \hat{T} \times, \quad \hat{+} = + \hat{0} +; \quad \hat{\div} = \div \hat{I} \div, \quad \hat{-} = - \hat{0} -; \quad a \hat{\times} b = ab \hat{T}, \quad a \hat{+} b = a + b + \hat{0}; \\ a \hat{\div} b &= \frac{a}{b} \hat{I}, \quad a \hat{-} b = a - b - \hat{0}; \quad a = a \hat{\times} a \hat{\div} a = a, \quad a = a \hat{+} a \hat{-} a = a; \\ a \hat{+} a &= 2a + \hat{0}; \quad a \hat{\div} a = \hat{I} \neq 1, \quad a \hat{-} a = -\hat{0} \neq 0; \quad \hat{T}\hat{I} = 1. \end{aligned} \quad (19)$$

$(\hat{+}, \hat{-}, \hat{\times}, \hat{\div})$  are four arithmetic operations in Santilli's new isomathematics.

**Remark,**  $a \hat{\times} (b \hat{+} c) = a \hat{\times} (b + c + \hat{0})$  , From left side we have  $a \hat{\times} (b \hat{+} c) = a \hat{\times} b + a \hat{\times} \hat{+} + a \hat{\times} c = a \hat{\times} (b + \hat{+} + c) = a \hat{\times} (b + \hat{0} + c)$  , where  $\hat{+} = \hat{0}$  also is a number.

$a \hat{\times} (b \hat{-} c) = a \hat{\times} (b - c - \hat{0})$  . From left side we have  $a \hat{\times} (b \hat{-} c) = a \hat{\times} b - a \hat{\times} \hat{-} - a \hat{\times} c = a \hat{\times} (b - \hat{-} - c) = a \hat{\times} (b - \hat{0} - c)$  , where  $\hat{-} = \hat{0}$  also a number.

**It is satisfies the distributive laws. Therefore  $\hat{+}, \hat{-}, \hat{\times}$  and  $\hat{\div}$  also are numbers.**

It is the mathematical problems in the 21st century and a new mathematical tool for studying and understanding the law of world.

## 2 Santilli's isoprime theory of the first kind

Let  $F(a, +, \times)$  be a conventional field with numbers  $a$  equipped with the conventional sum  $a + b \in F$ , multiplication  $ab \in F$  and their multiplicative unit  $1 \in F$ . Santilli's isofields of the first kind  $\hat{F} = \hat{F}(\hat{a}, +, \hat{\times})$  are the rings with elements

$$\hat{a} = a\hat{I} \quad (20)$$

called isonumbers, where  $a \in F$ , the isosum

$$\hat{a} + \hat{b} = (a + b)\hat{I} \quad (21)$$

with conventional additive unit  $0 = 0\hat{I} = 0, \hat{a} + 0 = 0 + \hat{a} = \hat{a}, \forall \hat{a} \in \hat{F}$  and the isomultiplications is

$$\hat{a} \hat{\times} \hat{b} = \hat{a}\hat{I}\hat{b} = a\hat{I}b\hat{I} = (ab)\hat{I}. \quad (22)$$

Isodivision is

$$\hat{a} \hat{\div} \hat{b} = \hat{I} \frac{a}{b} \quad (23)$$

We can partition the positive isointegers in three classes:

- (1) The isouniti  $\hat{I}$ ;
- (2) The isonumbers:  $\hat{1} = \hat{I}, \hat{2}, \hat{3}, \hat{4}, \hat{5}, \dots$ ;
- (3) The isoprime numbers:  $\hat{2}, \hat{3}, \hat{5}, \hat{7}, \dots$ .

**Theorem 1.** Twin isoprime theorem

$$\hat{P}_1 = \hat{P} + \hat{2}. \quad (24)$$

Jiang function is

$$J_2(\omega) = \prod_{3 \leq P} (P - 2) \neq 0, \quad (25)$$

whre  $\omega = \prod_{2 \leq P} P$  is called primorial.

Since  $J_2(\omega) \neq 0$ , there exist infinitely many isoprimes  $\hat{P}$  such that  $\hat{P}_1$  is an isoprime.

We have the best asymptotic formula of the number of isoprimes less than  $\hat{N}$

$$\pi_2(\hat{N}, 2) \sim \frac{J_2(\omega)\omega}{\phi^2(\omega)} \frac{N}{\log^2 N}, \quad (26)$$

where

$$\phi(\omega) = \prod_{2 \leq P} (P-1).$$

Let  $\hat{I} = 1$ . From (24) we have twin prime theorem

$$P_1 = P + 2 \quad (27)$$

**Theorem 2.** Goldbach isoprime theorem

$$\hat{N} = \hat{P}_1 + \hat{P}_2 \quad (28)$$

Jiang function is

$$J_2(\omega) = \prod_{3 \leq P} (P-2) \prod_{P|N} \frac{P-1}{P-2} \neq 0 \quad (29)$$

Since  $J_2(\omega) \neq 0$  every isoeven number  $\hat{N}$  greater than  $\hat{4}$  is the sum of two isoprimes.

We have

$$\pi_2(\hat{N}, 2) \sim \frac{J_2(\omega)}{\phi^2(\omega)} \frac{N}{\log^2 N}. \quad (30)$$

Let  $\hat{I} = 1$ . From (28) we have Goldbach theorem

$$N = P_1 + P_2 \quad (31)$$

**Theorem 3.** The isoprimes contain arbitrarily long arithmetic progressions.

We define arithmetic progressions of isoprimes:

$$\hat{P}_1, \hat{P}_2 = \hat{P}_1 + \hat{d}, P_3 = \hat{P}_1 + \hat{2} \hat{\times} \hat{d}, \dots, \hat{P}_k = \hat{P}_1 + (\hat{k} - I) \hat{\times} \hat{d}, (\hat{P}_1, \hat{d}) = \hat{I}. \quad (32)$$

Let  $\hat{I} = 1$ . From (32) we have arithmetic progressions of primes:

$$P_1, P_2 = P_1 + d, P_3 = P_1 + 2d, \dots, P_k = P_1 + (k-1)d, (P_1, d) = 1. \quad (33)$$

We rewrite (33)

$$P_3 = 2P_2 - P_1, P_j = (j-1)P_2 - (j-2)P_1, 3 \leq j \leq k. \quad (34)$$

Jiang function is

$$J_3(\omega) = \prod_{3 \leq P} [(P-1)^2 - \chi(P)], \quad (35)$$

$\chi(P)$  denotes the number of solutions for the following congruence

$$\prod_{j=3}^k [(j-1)q_2 - (j-2)q_1] \equiv 0 \pmod{P}, \quad (36)$$

where  $q_1 = 1, 2, \dots, P-1; q_2 = 1, 2, \dots, P-1$ .

From (36) we have

$$J_3(\omega) = \prod_{3 \leq P < k} (P-1) \prod_{k \leq P} (P-1)(P-k+1) \neq 0. \quad (37)$$

We prove that there exist infinitely many primes  $P_1$  and  $P_2$  such that  $P_3, \dots, P_k$  are all primes for all  $k \geq 3$ .

We have the best asymptotic formula

$$\begin{aligned} \pi_{k-1}(N, 3) &= |\{(j-1)P_2 - (j-2)P_1 = \text{prime}, 3 \leq j \leq k, P_1, P_2 \leq N\}| \\ &\sim \frac{J_3(\omega)\omega^{k-2}}{2\phi^k(\omega)} \frac{N^2}{\log^k N} = \frac{1}{2} \prod_{2 \leq P < k} \frac{P^{k-2}}{(P-1)^{k-1}} \prod_{K \leq P} \frac{P^{k-2}(P-k+1)}{(P-1)^{k-1}} \frac{N^2}{\log^k N}. \end{aligned} \quad (38)$$

**Theorem 4.** From (33) we obtain

$$P_4 = P_3 + P_2 - P_1, \quad P_j = P_3 + (j-3)P_2 - (j-3)P_1, \quad 4 \leq j \leq k. \quad (39)$$

Jiang function is

$$J_4(\omega) = \prod_{3 \leq P} ((P-1)^3 - \chi(P)), \quad (40)$$

$\chi(P)$  denotes the number of solutions for the following congruence

$$\prod_{j=4}^k [q_3 + (j-3)q_2 - (j-3)q_1] \equiv 0 \pmod{P}, \quad (41)$$

where  $q_i = 1, 2, \dots, P-1, i = 1, 2, 3$ .

From (41) we have

$$J_4(\omega) = \prod_{3 \leq P < (k-1)} (P-1)^2 \prod_{(k-1) \leq P} (P-1)[(P-1)^2 - (P-2)(k-3)] \neq 0. \quad (42)$$

We prove there exist infinitely many primes  $P_1, P_2$  and  $P_3$  such that

$P_4, \dots, P_k$  are all primes for all  $k \geq 4$ .

We have the best asymptotic formula

$$\begin{aligned} \pi_{k-2}(N, 4) &= |\{P_3 + (j-3)P_2 - (j-3)P_1 = \text{prime}, 4 \leq j \leq k, P_1, P_2, P_3 \leq N\}| \\ &\sim \frac{J_4(\omega)\omega^{k-3}}{6\phi^k(\omega)} \frac{N^3}{\log^k N} \\ &= \frac{1}{6} \prod_{2 \leq P < (k-1)} \frac{P^{k-3}}{(P-1)^{k-2}} \prod_{(k-1) \leq P} \frac{P^{k-3}[(P-1)^2 - (P-2)(k-3)]}{(P-1)^{k-1}} \frac{N^3}{\log^k N} \quad (43) \end{aligned}$$

The prime distribution is order rather than random. The arithmetic progressions in primes are not directly related to ergodic theory, harmonic analysis, discrete geometry and combinatorics. Using the ergodic theory Green and Tao prove there exist arbitrarily long arithmetic progressions of primes which is false [6,7,8,9,10].

**Theorem 5.** Isoprime equation

$$P_2 = \hat{P}_1 + 2 = P_1 \hat{I} + 2. \quad (44)$$

Let  $\hat{I}$  be the odd number. Jiang function is

$$J_2(\omega) = \prod_{3 \leq P} (P-2) \prod_{P|\hat{I}} \frac{P-1}{P-2} \neq 0. \quad (45)$$

Since  $J_2(\omega) \neq 0$ , there exist infinitely primes  $P_1$  such that  $P_2$  is a prime.

We have

$$\pi_2(N, 2) \sim \frac{J_2(\omega)\omega}{\phi^2(\omega)} \frac{N}{\log^2 N}. \quad (46)$$

**Theorem 6.** Isoprime equation

$$P_2 = (\hat{P}_1)^{\hat{I}} + 2 = P_1^{\hat{I}} + 2. \quad (47)$$

Let  $\hat{I}$  be the odd number. Jiang function is

$$J_2(\omega) = \prod_{3 \leq P} (P - 2 - X(P)), \quad (48)$$

where

$$X(P) = \begin{cases} \left(-\frac{-2I}{P}\right) \\ -1 & \text{if } P \mid \hat{I} \end{cases}$$

If  $\left(\frac{-2I}{3}\right) = -1$ , there infinitely many primes  $P_1$  such that  $P_2$  is a prime. If

$\left(\frac{-2I}{3}\right) = 1, J_2(3) = 0$ , there exist finite primes  $P_1$  such that  $P_2$  is a prime.

### 3 Santilli's Isoprime theory of the second kind

Santilli's isofields of the second kind  $\hat{F} = \hat{F}(a, +, \hat{\times})$  (that is,  $a \in F$  is not lifted to  $\hat{a} = a\hat{I}$ ) also verify all the axioms of a field.

The isomultiplication is defined by

$$a \hat{\times} b = a\hat{T}b. \quad (49)$$

We then have the isoquotient, isopower, isosquare root, etc.,

$$a \hat{\div} b = (a/b)\hat{I}, a^{\hat{n}} = a \hat{\times} \cdots \hat{\times} a \text{ (ntimes)} = a^n (\hat{T})^{n-1}, a^{\hat{1/2}} = a^{1/2} (\hat{I})^{1/2}. \quad (50)$$

**Theorem 7.** Isoprime equations

$$P_2 = P_1^2 + 6, P_3 = P_1^2 + 12, P_4 = P_1^2 + 18 \quad (51)$$

Let  $T = 1$ . From (51) we have

$$P_2 = P^2 + 6, P_3 = P^2 + 12, P_4 = P^2 + 18, \quad (52)$$

Jiang function is

$$J_2(\omega) = 2 \prod_{5 \leq P} \left( P - 4 - \left(\frac{-6}{P}\right) - \left(\frac{-3}{P}\right) - \left(\frac{-2}{P}\right) \right) \neq 0, \quad (53)$$

where  $\left(\frac{-6}{P}\right), \left(\frac{-3}{P}\right)$  and  $\left(\frac{-2}{P}\right)$  denote the Legendre symbols.

Since  $J_2(\omega) \neq 0$ , there exist infinitely many primes  $P_1$  such that  $P_2, P_3$  and  $P_4$  are primes.

$$\pi_4(N, 2) \sim \frac{J_2(\omega)\omega^3}{8\phi^4(\omega)} \frac{N}{\log^4 N} \quad (54)$$

Let  $\hat{T} = 5$ . From (51) we have

$$P_2 = 5P_1^2 + 6, P_3 = 5P_1^2 + 12, P_4 = 5P_1^2 + 18. \quad (55)$$

Jiang function is

$$J_2(\omega) = 8 \prod_{7 \leq P} \left( P - 4 - \left(\frac{-30}{P}\right) - \left(\frac{-15}{P}\right) - \left(\frac{-10}{P}\right) \right) \neq 0. \quad (56)$$

Since  $J_2(\omega) \neq 0$ , there exist infinitely many primes  $P_1$  such that  $P_2, P_3$  and  $P_4$  are primes.

We have

$$\pi_4(N, 2) \sim \frac{J_2(\omega)\omega^3}{8\phi^4(\omega)} \frac{N}{\log^4 N}. \quad (57)$$

Let  $\hat{T} = 7$ . From (51) we have

$$P_2 = 7P_1^2 + 6, P_3 = 7P_1^2 + 12, P_4 = 7P_1^2 + 18. \quad (58)$$

We have Jiang function

$$J_2(5) = 0. \quad (59)$$

There exist finite primes  $P_1$  such that  $P_2, P_3$  and  $P_4$  are primes.

**Theorem 8.** Isoprime equations

$$P_2 = P_1^{\hat{2}} + 30, P_3 = P_1^{\hat{2}} + 60, P_4 = P_1^{\hat{2}} + 90, P_5 = P_1^{\hat{2}} + 120. \quad (60)$$

Let  $\hat{T} = 7$ . From (60) we have

$$P_2 = 7P_1^2 + 30, P_3 = 7P_1^2 + 60, P_4 = 7P_1^2 + 90, P_5 = 7P_1^2 + 120. \quad (61)$$

Jiang function is

$$J_2(\omega) = 48 \prod_{11 \leq P} (P - 5 - \sum_{j=1}^4 (\frac{-210j}{P})) \neq 0. \quad (62)$$

Since  $J_2(\omega) \neq 0$ , there exist infinitely many primes  $P_1$  such that  $P_2, P_3, P_4$  and  $P_5$  are primes.

We have

$$\pi_5(N, 2) \sim \frac{J_2(\omega)\omega^4}{16\phi^5(\omega)} \frac{N}{\log^5 N}. \quad (63)$$

Let  $\hat{T} \geq 7$  be the odd prime. From (60) we have

$$P_k = P_1^2 \hat{T} + 30(k-1), k = 2, 3, 4, 5. \quad (64)$$

Jiang function is

$$J_2(\omega) = 8 \prod_{7 \leq P} (P - 5 - \chi(P)) \neq 0. \quad (65)$$

If  $P \mid \hat{T}$ ,  $\chi(P) = 4$ ;  $\chi(P) = \sum_{j=1}^4 (\frac{-30\hat{T}j}{P})$  otherwise.

Since  $J_2(\omega) \neq 0$ , there exist infinitely many primes  $P_1$  such that  $P_2, P_3, P_4$  and  $P_5$  are primes.

We have

$$\pi_5(N, 2) \sim \frac{J_2(\omega)\omega^4}{16\phi^5(\omega)} \frac{N}{\log^5 N}. \quad (66)$$

**Theorem 9.** Isoprime equation

$$P_3 = P_2 \hat{\times} (P_1 + b) - b. \quad (67)$$

Let  $\hat{T} = 1$  Jiang function is

$$J_2(\omega) = \prod_{3 \leq P \leq P_1} (P^2 + 3P + 3 - \chi(P)) \neq 0, \quad (68)$$

where  $\chi(P) = -P + 2$  if  $P \mid b$ ;  $\chi(P) = 0$  otherwise.

Since  $J_3(\omega) \neq 0$ , there exist infinitely many primes  $P_1$  and  $P_2$  such that  $P_3$  is also a prime.

The best asymptotic formula is

$$\pi_2(N, 3) = |\{P_1, P_2 : P_1, P_2 \leq N; P_3 = \text{prime}\}| \sim \frac{J_3(\omega)\omega}{4\phi^3(\omega)} \frac{N^2}{\log^3 N}. \quad (69)$$

**Theorem 10.** Isoprime equation

$$P_3 = P_2 \hat{\times} (P_1^{\hat{2}} + b) - b \quad (70)$$

Let  $\hat{T} = 1$  Jiang function is

$$J_3(\omega) = \prod_{3 \leq P \leq P_1} (P^2 - 3P + 3 + \chi(P)) \neq 0 \quad (71)$$

where  $\chi(P) = P - 2$  if  $P|b$ ;  $\chi(P) = \left(\frac{-b}{P}\right)$  otherwise.

Since  $J_3(\omega) \neq 0$ , there exist infinitely many primes  $P_1$  and  $P_2$  such that  $P_3$  is also a prime.

The best asymptotic formula is

$$\pi_2(N, 3) = |\{P_1, P_2 : P_1, P_2 \leq N; P_3 = \text{prime}\}| \sim \frac{J_3(\omega)\omega}{6\phi^3(\omega)} \frac{N^2}{\log^3 N}. \quad (72)$$

**Theorem 11.** Isoprime equation

$$P_3 = P_2^{\hat{2}} (P_1 + 1) - 1. \quad (73)$$

Let  $\hat{T} = 1$ . Jiang function is

$$J_2(\omega) = \prod_{3 \leq P \leq P_1} (P^2 - 3P + 4) \neq 0 \quad (74)$$

Since  $J_3(\omega) \neq 0$ , there exist infinitely many primes  $P_1$  and  $P_2$  such that  $P_3$  is also a prime.

The best asymptotic formula is

$$\pi_2(N, 3) = |\{P_1, P_2 : P_1, P_2 \leq N; P_3 = \text{prime}\}|$$

$$\sim \frac{J_3(\omega)\omega}{6\phi^3(\omega)} \frac{N^2}{\log^3 N}. \quad (75)$$

#### 4 Isoprime theory in Santilli's new isomathematics

**Theorem 12.** Isoprime equation

$$P_3 = P_1 \hat{+} P_2 = P_1 + P_2 + \hat{0}. \quad (76)$$

Suppose  $\hat{0} = 1$ . From (76) we have

$$P_3 = P_1 + P_2 + 1. \quad (77)$$

Jiang function is

$$J_3(\omega) = \prod_{3 \leq P} (P^2 - 3P + 3) \neq 0. \quad (78)$$

Since  $J_3(\omega) \neq 0$ , there exist infinitely many primes  $P_1$  and  $P_2$  such that  $P_3$  is also a prime.

We have the best asymptotic formula is

$$\pi_2(N, 3) \sim \frac{J_3(\omega)\omega}{2\phi^3(\omega)} \frac{N^2}{\log^3 N}. \quad (79)$$

**Theorem 13.** Isoprime equation

$$P_3 = (P_1 \hat{+} 2) \hat{\times} (P_1 \hat{-} 2) \hat{+} P_2 = T[P_1^2 - (2 + \hat{0})^2] + P_2 + \hat{0}. \quad (80)$$

Suppose  $\hat{T} = 6$  and  $\hat{0} = 4$ . From (80) we have

$$P_3 = 6(P_1^2 - 36) + P_2 + 4 \quad (81)$$

Jiang function is

$$J_3(\omega) = \prod_{3 \leq P} (P^2 - 3P + 2) \neq 0. \quad (82)$$

Since  $J_3(\omega) \neq 0$ , there exist infinitely many primes  $P_1$  and  $P_2$  such that  $P_3$  is also a prime.

We have the best asymptotic formula is

$$\pi_2(N, 3) \sim \frac{J_3(\omega)\omega}{4\phi^3(\omega)} \frac{N^2}{\log^3 N}. \quad (83)$$

### **Acknowledgements**

The author would like to express his deepest appreciation to A. Connes, R. M. Santilli, L. Schadeck, G. Weiss and Chen I-Wan for their helps and supports.
