June 14, 2012

Abstract: Accretion disks via gravity, magnetism or electricity do not exist. They are simply failed hypothesis used to explain away the formation of planets, exo-planets and stars which have no observational or theoretical basis.

No observational evidence for their existence and commonality has been observed. No lists of these objects have been compiled. No observational or theoretical basis for their ability to lose their angular momentum and condense into any celestial object exists. They are purely a hypothetical entity that has no basis in reality and are not objects worthy of any rational discourse similar to the non-existent “black hole” phenomenon.

Conclusion: No observational evidence of accretion disks exist, therefore accretion disks via gravity, magnetism or electricity do not exist.
