

Nasir's Three Laws of Gravitation

Law of Subatomic Gravitation

Gravity might be made up of subatomic particles that create a highly pressurized force that pulls downward upward and side to side. These subatomic particles are around the entire universe. They are called gravitation atomic particle.

Law of Subnuclear Power

Some subatomic particles are powerful enough to be what makes gravity itself.

Law of Unbalanced Gravitation

Different locations have different amounts of gravitational force. All of space does not have the same gravitational pull.
