

## Does Nibiru Have Life?

Nibiru is a planet believed to have not existed and never to be found. This planet is very strange in that it is a planet that we know little about. It appears this planet may have been discovered. This is a wonderful way to study this planet.

In this paper we will try to explain the likelihood of life on this planet even if it's micro. It have long believed that life may have once inhabited Mars. Is the same true for Nibiru? New findings suggest that it may, indeed, contain life.

Tom Zolotor

I believe that Nibiru does have life, in fact, a while ago at November 8, 2012 1:02 am, I spotted an object that looks close to Nibiru through my telescope if it is not nibiru itself. This is wh  
I believe that there is a huge likelihood that Nibiru exists.
