

## SMARANDACHE DETERMINANT SEQUENCES

Amarnath Murthy, S.E.(E&T) , WLS, Oil and Natural Gas Corporation Ltd.,  
Sabarmati, Ahmedabad,- 380005 INDIA.

In this note two types of Smarandache type determinant sequences are defined and studied.

### (1) Smarandache Cyclic Determinant Sequences:

#### (a) Smarandache Cyclic Determinant Natural Sequence:

$$\begin{vmatrix} 1 \end{vmatrix}, \begin{vmatrix} 1 & 2 \\ 2 & 1 \end{vmatrix}, \begin{vmatrix} 1 & 2 & 3 \\ 2 & 3 & 1 \\ 3 & 1 & 2 \end{vmatrix}, \begin{vmatrix} 1 & 2 & 3 & 4 \\ 2 & 3 & 4 & 1 \\ 3 & 4 & 1 & 2 \\ 4 & 1 & 2 & 3 \end{vmatrix}, \dots$$

$$1, -3, -18, \dots, 160, \dots$$

This suggests the possibility of the  $n^{\text{th}}$  term as

$$T_n = (-1)^{[n/2]} \{(n+1)/2\} \cdot n^{n-1} \quad \text{--- (A)}$$

Where  $[ ]$  stands for integer part

We verify this for  $n = 5$ , and the general case can be dealt with on similar lines.

$$T_5 = \begin{vmatrix} 1 & 2 & 3 & 4 & 5 \\ 2 & 3 & 4 & 5 & 1 \\ 3 & 4 & 5 & 1 & 2 \\ 4 & 5 & 1 & 2 & 3 \\ 5 & 1 & 2 & 3 & 4 \end{vmatrix}$$

on carrying out following elementary operations

(a)  $R_1 =$  sum of all the rows, (b) taking 15 common from the first row

(c) Replacing  $C_k$  the  $k^{\text{th}}$  column by  $C_k - C_1$ , we get

$$T_5 = 15 \begin{vmatrix} 1 & 0 & 0 & 0 & 0 \\ 2 & 1 & 2 & 3 & -1 \\ 3 & 1 & 2 & -2 & -1 \\ 4 & 1 & -3 & -2 & -1 \\ 5 & -4 & -3 & -2 & -1 \end{vmatrix} = 15 \begin{vmatrix} 1 & 2 & 3 & -1 \\ 1 & 2 & -2 & -1 \\ 1 & -3 & -2 & -1 \\ -4 & -3 & -2 & -1 \end{vmatrix}$$

$R_1 - R_2, R_3 - R_2, R_4 - R_2,$  gives

$$15 \begin{vmatrix} 0 & 0 & 5 & 0 \\ 1 & 2 & -2 & -1 \\ 0 & -5 & 0 & 0 \\ -5 & -5 & 0 & 0 \end{vmatrix} = 1875, \{\text{the proposition (A) is verified to be true}\}$$

The proof for the general case though clumsy is based on similar lines.

**Generalization:**

This can be further generalized by considering an arithmetic progression with the first term as  $a$  and the common difference as  $d$  and we can define

**Smarandache Cyclic Arithmetic determinant sequence as**

$$\begin{vmatrix} a \end{vmatrix}, \begin{vmatrix} a & a+d \\ a+d & a \end{vmatrix}, \begin{vmatrix} a & a+d & a+2d \\ a+d & a+2d & a \\ a+2d & a & a+d \end{vmatrix}, \dots$$

**Conjecture-1:**

$$T_n = (-1)^{[n/2]} S_n \cdot d^{n-1} \cdot n^{n-2} = (-1)^{[n/2]} \cdot \{a + (n-1)d\} \cdot \{1/2\} \cdot \{nd\}^{n-1}$$

Where  $S_n$  is the sum of the first  $n$  terms of the AP

**Open Problem:** To develop a formula for the sum of  $n$  terms of the sequence.

**(2) Smarandache Bisymmetric Determinant Sequences:**

**(a) Smarandache Bisymmetric Determinant Natural Sequence:**

The determinants are symmetric along both the leading diagonals hence the name.

$$\begin{vmatrix} 1 \end{vmatrix}, \begin{vmatrix} 1 & 2 \\ 2 & 1 \end{vmatrix}, \begin{vmatrix} 1 & 2 & 3 \\ 2 & 3 & 2 \\ 3 & 2 & 1 \end{vmatrix}, \begin{vmatrix} 1 & 2 & 3 & 4 \\ 2 & 3 & 4 & 3 \\ 3 & 4 & 3 & 2 \\ 4 & 3 & 2 & 1 \end{vmatrix}, \dots$$

$$1, -3, -12, \dots, 40, \dots$$

This suggests the possibility of the  $n^{\text{th}}$  term as

$$T_n = (-1)^{\lfloor n/2 \rfloor} \{n(n+1)\} \cdot 2^{n-3} \quad (\text{B})$$

We verify this for  $n = 5$ , and the general case can be dealt with on similar lines.

$$T_5 = \begin{vmatrix} 1 & 2 & 3 & 4 & 5 \\ 2 & 3 & 4 & 5 & 4 \\ 3 & 4 & 5 & 4 & 3 \\ 4 & 5 & 4 & 3 & 2 \\ 5 & 4 & 3 & 2 & 1 \end{vmatrix}$$

on carrying out following elementary operations

(b)  $R_1 = \text{sum of all the rows}$ , (b) taking 15 common from the first row, we get

$$15 \begin{vmatrix} 1 & 2 & 3 & 2 \\ 1 & 2 & 1 & 0 \\ 1 & 0 & -1 & -2 \\ -1 & -2 & -3 & -4 \end{vmatrix}$$

$R_1 = R_1 + R_4$  gives

$$15 \begin{vmatrix} 0 & 0 & 0 & -2 \\ 1 & 2 & 1 & 0 \\ 1 & 0 & -1 & -2 \\ -1 & -2 & -3 & -4 \end{vmatrix} = 120, \text{ which confirms with (B)}$$

The proof of the general case can be based on similar lines.

**Generalization:** We can generalize this also in the same fashion by considering an arithmetic progression as follows:

$$\begin{vmatrix} a \end{vmatrix}, \begin{vmatrix} a & a+d \\ a+d & a \end{vmatrix}, \begin{vmatrix} a & a+d & a+2d \\ a+d & a+2d & a+d \\ a+2d & a+d & a \end{vmatrix}, \dots$$

**Conjecture-2:** The general term of the above sequence is given by

$$T_n = (-1)^{\lfloor n/2 \rfloor} \cdot \{ a + (n-1)d \} \cdot 2^{n-3} \cdot d^{n-1}$$
