Abstract

The steady increase in the number of mysterious puzzles of the universe is a sign of imperfection of existing theories and ideas about the world, contributing to the creation of a radically new alternative ideas and theories. New ideas need to be punching and clear to all without any special training. They should also contribute to the adequate perception of reality and be connected with each other and with the existing scientific knowledge. In this case, alternative ideas will inevitably become penetrative!

Here are the results of many years of theoretical studies of the structure and evolution of the universe in relation to climatic disasters and physical properties of the Earth. In total 6 hypothesis are presented.

Keywords: hypothesis, extraordinary events, universe, cataclysm, Earth

## **1. The cyclical change the Earth's climate as a consequence of the structure and evolution of the universe.**

Based on the fundamental hypothesis of the universe (see - "Our closed and ordered Universe"), it is logical to have the right to existence of the following hypotheses:

**1.1. Cyclical nature of the solar hypothesis [1]** Solar cyclical due to cyclical fluctuations of the internal pressure of the energy (temperature) of the solar system. The main reason for changes in the pressure of the solar energy system is its movement in our galaxy, accompanied by fluctuations in the radius of the orbit.

**1.2. The hypothesis of the nature of long-term changes in Earth's climate [2]** The main cause of long-term changes in the Earth's climate is the motion of the solar system through a "layered" energy education as our galaxy and throughout the universe. Over time, the frequency of changes in the Earth's climate must increase, because of the accelerated movement of galaxies, and the average temperature decrease and eventually come "eternal winter."

## **2. Secrets of the universe are revealed here - on Earth.**

**2.1. The hypothesis of occurrence of extreme events of natural origin [3]** The main cause of extreme events in the world is the difference between the speeds of its shell and the contents (crust and mantle). Moving epicenters of extreme events on the Earth's surface - the result (light) movement of gravitational structures in the outer layers of the mantle. Studies of the structure and movement of the inner layers of the earth - that's the key to understanding, predicting and countering extreme events.

**2.2. The hypothesis of the nature of origin of volcanoes and earthquakes [4]** Mantle (with its gravitational formations) at the expense of its movement relative to the cortex "rips input plug" crater of the volcano, which, in turn, due to its forced movement contributes to the earthquake and "opens" the way the movement of the mantle out (eruption).

**2.3. The hypothesis of the emergence of the killer waves [5]** Waves killer - is the result of the occurrence and movement of gravitational formations in the upper layers of the mantle relative to the surface of the Earth.

**2.4. The hypothesis of occurrence of the noise of the earth [6]** The noise of the earth - is a consequence of non-uniform motion of the upper layers of the mantle relative to the inner surface of the Earth's crust.

**3. We have suggested just a few fragments of the project we had created, and, in the case of further development of the direction of research suggested by us, scientists will discover the history and predict the future of our planet and the entire Universe!**
