HYPOTHESIS OF THE STRUCTURE AND EVOLUTION OF PLANETS

Solid-state planets at the final stage of evolution become hollow, and gaseous – solid-state! Belt of asteroids are splinters of the cover of the phaeton, which kernel – ceres!

**SOLID-STATE PLANETS AT THE FINAL STAGE OF EVOLUTION
BECOME HOLLOW, AND GASEOUS – SOLID-STATE!**

The fact of its recognition or full ignoring by scientists will become the proof of correctness of this hypothesis.

On the basis of the made hypothesis we claim:

**BELT OF ASTEROIDS ARE SPLINTERS OF THE COVER OF THE
PHAETON, WHICH KERNEL – CERES!**

We don't provide any additional comments of rather this statement as we consider it obvious taking into account that the belt of asteroids is in a border area between solid-state and gaseous planets.
