We exist in a galaxy by the name of the Universe (1) which is limited and ordered (2) and where there are known physical laws sufficient for understanding of the phenomena and cataclysms occurring in it today. The climate of Earth, mainly, is determined by an energy condition of the space surrounding it!

Hypothesis 1: "Settling" of Earth has begun with poles!

Temperature on the Earth's surface is defined by total thermal influence of Earth (internal) and the Sun (external) therefore on the equator temperature is always higher, than on poles.

In the course of evolution of Earth temperature on poles fell to optimum value for origin of life, and on the equator remained too high.

Subsequently poles "are cooled", the zone of optimum temperature is displaced closer to the equator, so and "life" that we also have today.

The warming seeming now – only a temporary phenomenon which is defined by a power condition of space of the Solar system moving in a galaxy "Milky Way", and that, in turn, to suburbs of the Universe.

Hypothesis 2: The general cold snap on Earth is inevitable!
