## PROOF OF GOLDBACH CONJECTURE

## Ryujin Choe

Lenth of  $[3, 3, 5, 5, 7, 7, \dots, p_t, p_t] < 2t$ When  $p_t$  is greatest prime below  $\sqrt{2T}$ , simply arrange them. if every prime  $p_i$  takes up space every  $p_i$ th, Greatest lenth of  $[3, 3, 5, 3, 3, 5, \dots, p_t, 3, 3] < 2 \cdot \prod_{i=2}^t \left(\frac{p_i}{p_i - 2}\right) \cdot 2t$ for exemple, when  $p_t = 7$ , Lenth of [3, 3, 5, 3, 3, 5, 3, 3, 7, 3, 3, 7, 3, 3] = 14 is maximum. and  $2 \cdot \prod_{i=2}^t \left(\frac{p_i}{p_i - 2}\right) \cdot 2t$  <number of pairs of (2n + 1, 2T - 2n - 1)Hence, every 2T greater than 2 can be expressed as the sum of two primes.
