*Abstract: Cosmologists use equivocation, which confuses the public and even themselves. They do this to make sure they can never be wrong in any situation, by never taking a stance one way or the other. Their intent is to deceive to protect their careers and to sell books that say nothing. It is essentially a political tactic that does not belong in science, and neither does cosmology (which is a quasi-religion) as a whole.*

In astrophysics, plasma recombination happens when an ionized particle combines with another ionized particle forming a neutral particle. This process releases heat and is a simple thermodynamic phase transition in which a plasma (ionized gas) becomes a gas (neutral). The next two lowering of the enthalpies of the gas can happen via deposition (gas directly deposits as solid material), or condensation (the gas transitions to a liquid). They have very clear transitions as defined in basic thermodynamics. The fallacy of equivocation happens when the Army of quasi-religious cosmologists apply a thermodynamic phase transition to the earliest stages of their big bang creationism idea. They hijacked the concept of hydrogen recombination and applied it to an entire epoch, after the initial explosion of the big bang creation event. They equivocated the thermodynamics of an ionized to neutral gas (something that happens in stars) and applied it to a fantasy idea that has no basis in reality. They took an actual observation and forced it to apply to an event that was never observed. In fact, there is no observational evidence for a big bang creation. Plasma recombination happens in events that are observed, in stars and even in lightning and different types of light bulbs. Taking actual science and understandable explanation and equivocating it to an idea that is pure fantasy is a recipe for psychological illness. Just so the reader is made aware, it is very dangerous to accept any cosmology related idea, because cosmologists tend to hijack words and equivocate them into nothingness. The people who study cosmology end up doing circles around themselves and others, a kind of pseudo-intellectualism that puts up the front of being actual science (it isn't).

To drive this idea home, they are essentially inverting the meaning of recombination. They are saying that before the hydrogen is made, everything was all protons/electrons to a certain extent, but recombination is clear a **re-combination**. That word literally means the hydrogen was first a gas, THEN it was ionized, then it was **re-combined**. If they really did not want to get called out on their hijacking of the term, they should have used the word "combination" or "combination epoch". Which is further evidence they hijacked the term to suit their fantasy. To expose the cosmologists for the giant big bang creation scam, all the reader needs to do is examine the words they use and play connect the dots. They abuse and equivocate language all over the place to suit their agenda.
