

Have pleased under the gravitational guillotine

Nikitin V.N., Nikitin I.V.

Interaction of material objects needs to be considered taking into account a possibility of existence of a horizontal component of gravitation.

Have pleased under the gravitational guillotine

The horizontal component of gravitation causes effect of the gravitational guillotine (effect of GG) which is shown in the form of the relative shift of the interconnected material objects. In space scale the effect of GG is visually shown in the relative movement of planets of Solar system, in near-earth conditions causes illusion of creation of the space elevator. The same can be assumed for underground space and as confirmation to it, the fact the break of a cable of a drill in the Kola superdeep well – with a diameter of well of 20 cm arises a question: "Where the drill and several kilometers (!) of a steel cable has disappeared?".

It is obvious that the drill and a cable have been "simply taken" by the sliding rock sheet.

Hypothesis: interaction of material objects needs to be considered taking into account possible existence of a horizontal component of gravitation.
