"PROOF OF PRINCIPLE" FOR SITUATIONAL UNDERLYING VALUE (SUV) –

A Statistic to Measure Clutch Performance by Individuals in the Team Sports of Major League Baseball, Professional Football (NFL) and NCAA Men's College Basketball

Raymond HV Gallucci, PhD, PE; gallucci@localnet.com; r_gallucci@verizon.net

NOTE: Due to size limitations, this has been published in three separate parts, with the abstract and references to all three parts included with each. This is Part 1, directed exclusively to Major League Baseball.

In Situational Underlying Value for Baseball, Football and Basketball – A Statistic (SUV) to Measure Individual Performance in Team Sports, an all-encompassing, overall statistic to measure "clutch" performance by individual players in the team sports of major league baseball, professional football (NFL), and NCAA men's college basketball was developed, called "Situational Underlying Value" (SUV). This work supplements and extends the development and initial demonstrations of the use of the SUV statistic for these three team sports by tracking the performance of three specific teams in these three sports over a significant portion of their most recent seasons: (1) for major league baseball, 54 of the 162 games played by the Seattle Mariners in 2017; (2) for professional football, five of the 16 games played by the Seattle Seahawks in 2017; and (3) for NCAA Men's College Basketball, the five games played by the Loyola of Chicago Ramblers in the 2018 NCAA Division I Men's Basketball Tournament. The SUV statistics for the players who participated in these games are tracked and accumulated for comparison among themselves and, for those who participated in a significant portion of these games, further compared against the traditional statistics for each team over the entire season (or, in the case of the Loyola of Chicago Ramblers, the complete five games of the Basketball Tournament). The goal is to examine the efficacy of this one overarching statistic, the SUV, in representing player performance "in the clutch" vs. more subjective interpretation of the myriad of different "traditional" statistics currently used. Anomalies between the SUV and "traditional" statistics results are examined and explained, to the extent practicable given the scope of the SUV analysis (partial seasons). Whether or not this effort proves successful is left to the reader's conclusion based on the results and comparisons performed.

**SITUATIONAL UNDERLYING VALUE (SUV) STATISTIC
FOR MAJOR LEAGUE BASEBALL –
PROOF OF PRINCIPLE**

Raymond HV Gallucci, PhD, PE; gallucci@localnet.com; r_gallucci@verizon.net

In Situational Underlying Value for Baseball, Football and Basketball – A Statistic (SUV) to Measure Individual Performance in Team Sports, an all-encompassing, overall statistic to measure "clutch" performance by individual players in the team sports of major league baseball, professional football, and NCAA men's college basketball was developed, called "Situational Underlying Value" (SUV). [1] Based on the concept of "run expectancy," it assigns an SUV to each base as a function of the number of outs, including a negative value for making an out. It can be used for both hitters and pitchers, with the higher the SUV (i.e., the more positive or less negative) reflecting better productivity for hitters and the lower the SUV (i.e., the more negative or less positive) reflecting likewise for pitchers. Its derivation is explained in Reference 1; reproduced here is the SUV table for major league baseball (variations for the American and National League are also discussed there to reflect the use of the designated hitter by the former, but will not be addressed here). For example, a double is worth 0.63, 0.44, or 0.23, respectively, with none, one or two outs when it occurs. Making the first, second or third out deducts 0.23, 0.16, or 0.10, respectively. Advancing base runners without additional outs always improves the SUV, attributable to the hitter if a direct result of his action (e.g., another hit) or the runner (e.g., stolen base or wild pitch). "Unearned" plays, such as errors, passed balls, or catcher's interference, are tracked separately and the corresponding SUVs are not assigned to the individuals. Pinch runners also are not tracked unless they themselves are responsible for advancing (e.g., stolen base or wild pitch) or making an out (e.g., being picked off or thrown out trying to take an extra base).

base→ outs↓	3	2	1	0
0	0.87	0.63	0.39	-0.23
1	0.68	0.44	0.22	-0.16
2	0.29	0.23	0.12	-0.10

Reference 1 provides two example games to show how the SUVs accrue for each team's hitters and pitchers. The goal of this work, the "Proof of Principle," is to track the performance of an individual team over a substantial portion of an entire season. One-third of the 2017 season, i.e., 54 games, have been selected for the Seattle Mariners, starting with Game 002 and tracking every third game up through Game 161. The SUVs are based on the play-by-play descriptions provided in "Baseball Reference," https://www.baseball-reference.com/. [2] While the SUV analyses for all 54 games are provided below, with a roll-up of cumulative SUVs every six games, the actual play-by-plays are only included for three particular games, particularly illustrative. For the rest, the reader should consult Reference 2. Below is an example of one such analysis, as follows:

Each hitter from Segura through Valencia had the number of "opportunities" totaled in the "Ops" column, i.e., appearances at the plate as a hitter which resulted in an outcome for that hitter (or the rare case where a pinch runner made a direct change himself to the SUV). His total SUV for the game is shown in the "SUV" column, with his average SUV per Opportunity for the game calculated in the "Avg" column. For example, Cano had five opportunities with a total SUV of 2.10, for an Average of 2.10/5 = 0.420, indicating a

productive day where each appearance was worth 0.420 on average. The next three columns are labeled similarly, but include a "+" symbol to indicate that these are cumulative for the season through this game. The row "SUV" shows the total per inning (always the number of runs minus 0.49, including the "unearned" SUV), followed by the totals for Ops and SUV for the game (42 and 1.42 in this example), the Average per Op for the team for the game (1.42/34 = 0.034 for this example), and the cumulatives for these through this game (1909, 8.55, and 8.55/1909 = 0.004, respectively). Anything highlighted in yellow indicates an SUV attributable to an error, passed ball (PB), or catcher's interference (CI), which is tracked for the team and highlighted for that player who receives no credit toward his SUV due to the error and for whom the SUV is calculated as if the error had not occurred, i.e., he had made the out. For the Mariners in this game, there was an "unearned" SUV of 0.17 in the seventh inning, involving both Gamel and Heredia. The game and cumulative totals for these (0.17 and 16.42 in this example) are also tracked. Finally, the total SUVs for the game (1.59, based on the Mariners scoring six runs over nine innings, i.e., 6 – [9][0.49] = 1.59, equal to 1.42 + 0.17 = 1.59) and cumulatively (8.55 + 16.42 = 24.97) are highlighted in **bold red**. (In the rare case where a hitter batted twice in one inning, this is shown in a bolded box and included both Ops [e.g., see Game 059, June 6, Minnesota-3 @ Seattle-12; Zunino batted twice in the third inning, leading off with a single but also making last out for a total SUV over two Ops of 0.39 – 0.10 = 0.29].)

Mariner	1st	2nd	3rd	4th	5th	6th	7th	8th	9th	Ops	SUV	Avg	+Ops	+SUV	+Avg

Simmons							-0.49			1.00	-0.49	-0.490	3.00	-1.73	-0.577
Diaz									-0.49	1.00	-0.49	-0.490	19.67	2.07	0.105
SUV	-0.49	-0.49	-0.49	6.51	-0.49	0.51	-0.49	-0.49	-0.49	9.00	2.32	0.258	444.67	2.62	0.006
Error/PB/CI				1.27							1.27	**3.59**		22.43	**25.05**

The SUVs are similarly tracked for the pitchers, although not by individual hitter faced unless the pitcher worked only part of an inning (Hernandez and Albers in the fifth, Albers and Lawrence in the sixth). Each pitcher's "Innings Pitched" ("IP" column) are tracked for the game along with his SUV ("SUV" column) and Average per inning pitched ("Avg" column). For example, Hernandez pitched 3.33 innings, with a total SUV of 1.37 for an Average per IP of 1.37/3.33 = 0.411, not a very productive outing. The pitcher's cumulative totals for these are tracked in the last three columns with the "+" symbols. The "SUV" row shows the totals per inning, again amounting to the number of runs yielded, including the "unearned" SUV tracked below in yellow, minus 0.49. The totals for IP and SUV follow, with the team's Average per IP next, and finally the cumulatives for these three. As can be seen, the fourth inning was particularly bad for the Mariners, yielding seven runs with an SUV of 7 – 0.49 = 6.51, of which 1.27 was attributed to the "unearned" variety (while Hernandez was pitching, and not counted against him). The opponent scored

a total of eight runs, for a total SUV = 8 – (9)(0.49) = 3.59, shown in **bold red**, of which 1.27 was "unearned" (equal to 2.32 + 1.27 = 3.59). Cumulatives for these follow (2.62 and 22.43 ["unearned] for a total of 25.05, shown in **bold red**).

This is the pattern followed for each game (except the first, for which there is no cumulative shown). Below is a list of the 54 games analyzed, followed by the analyses for each of the 54 games (plus roll-ups for every six games).

From Reference 2 the complete season batting and pitching statistics for all the Mariner players are shown above (except for WAR, discussed below). These are followed by the 54-game SUV

statistics for batting and pitching for the top 10 players with the most Opportunities and Innings Pitched, using a lower limit of 124 Opportunities (Dyson) and 21.00 Innings Pitched (Vincent). No contribution from Error/PB/CI is included here. The totals for each group of 10 players, along with the mean and standard deviation, in each category, "+SUV" and "+Avg" are calculated to enable a normalization of the statistics for each of the 10 players per group as follows:

$$Normalized\ Statistic\ (+SUV\ or + Avg) = \int_{-\infty}^{x} \frac{1}{\sigma\sqrt{2\pi}} e^{-\left(\frac{[x-\mu]^2}{2\sigma^2}\right)} dx$$

where μ = mean and σ = standard deviation.

These normalized statistics, representing the percentiles of the normal distribution where the statistics occur, are calculated for both "+SUV" and "+Avg" for the players in each group. Within each group, these two normalized statistics for each player are then averaged ("Both" column) and used to rank the players from first through tenth. Note that, for batters, higher values are desirable. For pitchers, the lower values are desirable. The reason for considering both "+SUV" and "+Avg" is that the former reflects longevity (most Opportunities or Innings Pitched) over a season while the second reflects expected performance per Opportunity or Inning Pitched. Combined, both aspects are reflected. This is akin to giving additional weight to the 0.300-hitter who had 150 hits in 500 at-bats over the one with 30 hits in 100 at-bats.

As an example calculation, consider Seager, who has a +SUV = 14.06 and +Avg = 0.068. When normalized to the mean +SUV = 2.81 and mean +Avg = 0.011 (with respective standard deviations of 7.41 and 0.042), his normalized +SUV and +Avg become as follows:

$$Normalized + SUV = \int_{-\infty}^{14.06} \frac{1}{(7.41)\sqrt{2\pi}} e^{-\left(\frac{[14.06-2.81]^2}{2[7.41]^2}\right)} dx = 0.936$$

$$Normalized + Avg = \int_{-\infty}^{0.068} \frac{1}{(0.042)\sqrt{2\pi}} e^{-\left(\frac{[0.068-0.011]^2}{2[0.042]^2}\right)} dx = 0.915$$

These indicate that his +SUV occurs at the 93.6%ile and +Avg at the 91.5%ile, both the highest among the 10 batters. The average of the two is 0.925, which ranks him first overall among the batters, just slightly above Cruz at 0.903. Since lower values are optimal for pitchers, Bergman ranks first with 0.033, significantly ahead of the next pitcher, Vincent, at 0.195. Given his lowest +SUV = -8.67 and lowest +Avg = -0.309 among the 10 pitchers with at least 21.00 Innings Pitched, this comes as no surprise.

What is especially interesting, and the goal of developing the SUV statistic, are insights into players' performance "in the clutch" that may not be readily indicated by the myriad of other statistics currently being used.[1] Below are the season statistics (now including WAR) for the top

---

[1]   Since only 54 of the total 162 games have been analyzed for SUV, all the following "insights" regarding individual players should be taken with "a grain of salt" as merely illustrative as if the entire season had been analyzed for SUV. As will be shown below for Ramirez, if the selected games happened to correspond to atypically better or poorer performances by the player than what transpired over the entire season, the "insights" may be biased by the limited selection. While 1/3 of the season is considered to be a significant sample for analysis, it remains possible that atypical player performance has been highlighted. All subsequent "insights" are

10 batters and pitchers from the SUV lists based on the compilations shown above from Reference 2. To characterize player performance based on such multiple statistics, the approach taken is similar to that for the two SUV statistics, "+SUV" and "+Avg," i.e., the players are ranked by normalization of the statistics for selected categories, then these normalized values are averaged to yield one overall result, used to rank the players. For batting, a combination of longevity (Runs, Hits, RBIs, and WAR [Wins Against Replacement]) and expected performance per "at-bat (AB)" statistics (Runs/AB, Hits/AB [Batting Average], OBP [On-Base Percentage] and SLG [Slugging Percentage]), i.e., a total of eight statistics, are used. For pitching, four longevity (Hits, Earned Runs, Bases-on-Ball + Hits-By-Pitch, and WAR) and two expected performance per Inning Pitched statistics (Earned Run Average and Walks+Hit-Batters per IP), i.e., a total of six statistics, are used. Note that, for pitchers, all but the WAR statistic indicate better performance with lower values. Therefore, to incorporate WAR consistently with the rest, its normalized value is subtracted from 1.00 (since we are dealing with probabilities), such that the lower value ("1-WAR") represents better performance.

Within the constraints of the comparison (SUV analysis is based on only one-third, i.e., 54 games, of the season vs. Reference 2's complete season; and the subjectivity of which statistics to select for the comparison and use of normalization and subsequent averaging to yield a "performance measure" that can be compared to the SUV), the results provide insights that might not readily be found from the current myriad of statistics. Among the batters, Seager and Cruz stood out as the top performers, with a fairly wide margin over the next lower player (Cano); while Zunino and Heredia were the poorest, significantly below the next higher player (Dyson). When the full season "traditional" statistics are used, Cruz stands out at the top and Heredia at the bottom, similar to the SUV results, with Seager and Zunino falling in the middle. Again, this comparison is arbitrary, and the SUV analysis uses only 54 of the 162 games, but if one envisions the SUV results to be representative of a full-season performance, they indicate that Seager performed well in the clutch, much better than his "traditional" statistics would seem to indicate. Meanwhile, Zunino did not perform well in the clutch, despite fairly good "traditional" statistics. Such insight could be quite valuable to an owner, general manager, and manager (and hitting coach) when assembling a roster and line-up.

For pitchers based on their SUV, Bergman stood out at the top, with Vincent and Paxton next and well above the rest of the group; while Ramirez and Miranda were the poorest, well below the next higher player (Gallardo). Based on the full season's "traditional" statistics, Vincent comes out on top, followed by Diaz and Ramirez (the bottom performer based on the SUV), with Bergman and Paxton in the middle. Gallardo and Miranda are at the bottom, consistent with their SUV ranks. However, there is quite a discrepancy for Ramirez – a good performer according to the "traditional" statistics, but a poor one according to SUV. Ignoring the possibility (likelihood [see footnote]) that this discrepancy is the result of Ramirez' games included for the SUV just happening to be his worst, this suggests that he does not perform well in the clutch despite good "traditional" statistics.[2] Meanwhile, Bergman performs much better in the clutch than his

---

intended to be illustrative only, not necessarily reflecting deviations from any individual player's overall performance, either better or worse.

[2] In fact, review of the four games where Ramirez pitched (#s 113, 128, 143 and 149) among the 54 selected for the SUV analysis indicates that he performed quite poorly relative to what would have been expected if all of his games were included. Over those four games, he pitched 21.67 innings, yielding 27 hits, 16 earned runs, and six walks (no-hit batters), corresponding to an ERA = 6.65 and WHBIP = 1.52 (WAR was not tracked). If his season statistics were apportioned by the ratio of 21.67 innings to his total of 62 innings, the expected hits, earned runs, walks (plus hit-batters), ERA and WHBIP would have been 19.92, 9.44, 5.59, 3.92 and 1.18, respectively. All but the walks (plus hit-batters) over those four games were at least 29% higher than would have been expected,

"traditional" statistics would seem to indicate. Again, to the extent the SUV results for 54 games are representative for an entire season, such insight could be quite valuable to an owner, general manager, and manager (and pitching coach).

especially the earned runs and ERA (70% higher). Therefore, it appears the four games out of the 54 selected for the SUV analysis just happened to be poor ones for Ramirez, atypical of his overall performance. Analysis of all 162 games for SUV would be expected to bring these into better alignment.

Finally, while Reference 1 analyzes two games in detail for both teams to illustrate how the SUV is calculated and used, it should be helpful to do so here for three selected games from the list of 54. The games chosen represent (1) one with several "unearned" SUVs (Game 131, August 27, Seattle-1 @ N.Y. Yankees-10); (2) one where the Mariners "batted around" (10 men in one inning - Game 059, June 6, Minnesota-3 @ Seattle-12); and (3) a ninth-inning walk-off (Game 038, May 14, Seattle-2 @ Toronto-3). For each of these, the complete play-by-play from Reference 2 is provided. Innings of especial interest are described in detail, with the remainder left to the reader to calculate as desired given the complete play-by-play.

GAME 131, AUGUST 27, SEATTLE-1 @ N.Y. YANKEES-10

Play-by-Play Explanation

Score- The score from the perspective of the batting team.
RoB- This gives the baserunner (Runners on Base) configuration at the start of the play. "1-3" would mean runners on first and third. Clicking on this will show the defensive players and baserunners on the field for this play.
Pit- When available, the number of pitches in this plate appearance. Clicking on this number will show the sequence of pitches thrown including, when available, things like runner going, ball blocked, attempted pickoffs and the like. We believe this data to be as accurate as humanly possible, but there are going to be some errors in the data, so please take it with a grain of salt. Clicking on this will show the defensive players and baserunners on the field for this play.
R/O- This has a "O" for every out on the play and an "R" for every run that scored on the play. Some plays will have both in no particular order.
Batter- The batter at the plate when this play occurred. If the play is a baserunning event, then the batter's name will be repeated as indicated by quotes.
Pitcher- The pitcher on the mound when this play occurred.
wWPA- Winning Team's Win Probability Added. The amount that this play increased or decreased the eventual winning team's probability of winning the game. More About Win Probability Added
wWE- Winning Team's Win Expectancy. The probability of the eventual winning team winning the game at the end of this play given two average teams playing each other. More About Win Probability Added
Play Detail- This is an explanation of the play that occurred. In some cases, batted ball location and type will be indicated within parentheses. Again, these are best efforts to record the game as it happened. Also, plays made on the baserunners (including the batter as a baserunner) will be indicated in parentheses after the baserunner's name. Advancement of baserunners is given in cases where the advancement is not easily deduced or obvious from the play. For example, advancement for a walk will not be given, but for a single or double it will be given.

The first inning, with errors involved in the scoring for both teams, is of primary interest for illustration here. Seattle's inning goes as follows. Segura makes the first out (SUV = -0.23). Alonso singles (SUV = 0.22) and advance to second on an error (unearned SUV = 0.44 – 0.22 = 0.22). Cano singles (SUV = 0.22), advancing Alonso to third (SUV = 0.68 – 0.44 = 0.24), giving Cano a total of 0.46. Cruz doubles (SUV = 0.44) scoring Alonso (SUV = 1 – 0.68 = 0.32) and advancing Cano to third base (SUV = 0.68 – 0.22 = 0.46), giving Cruz a total of 1.22. With runners on second and third, Seager strikes out (SUV = -0.16), leaving Cano at third, now with two outs (SUV = 0.29 – 0.68 = -0.39), and Cruz at second (SUV = 0.23 – 0.44 = -0.21), giving Seager at

total of -0.76. Finally, Haniger ends the inning with the third out (SUV = -0.10), stranding both runners (SUV = -0.29 for stranding Cano, plus SUV = -0.23 for stranding Cano), giving Haniger a total of -0.62. Therefore, when the six players' SUVs (-0.23 + 0.22 + 0.46 + 1.22 – 0.76 – 0.62 = 0.29) are combined with the unearned SUV due to the error (0.22), the total SUV becomes the expected 1 – 0.49 = 0.51 for one run scored.

The Yankees' first inning is even more interesting, including three errors, and is likely as complicated as any SUV calculation can get. However, since only the pitcher's SUV is of interest, the individuals' SUVs are not separately tracked. Here is how Albers' SUV is calculated. Hicks makes the first out (Albers' SUV = -0.23). Castro doubles (Albers' SUV = 0.44, cumulative = -0.23 + 0.44 = 0.21). Sanchez singles in Castro (Albers' SUV = 1 – 0.44 = 0.56 for scoring Castro, plus SUV = 0.22 for the single) and advances to second on an error (unearned SUV = 0.44 – 0.22 = 0.22), but this is not charged to Albers. Therefore, Albers' cumulative SUV = 0.21 + 0.56 + 0.22 = 0.99, with 0.22 unearned being tracked separately. Judge walks, adding 0.22 to Albers' SUV, now at 1.21. Gregorius reaches first on an error (unearned SUV = 0.22), advancing Sanchez to third (unearned SUV = 0.68 – 0.44 = 0.24) and Judge to second (unearned SUV = 0.44 – 0.22 = 0.22). Without the error, a second out (SUV = -0.16) would have been recorded, with Sanchez remaining at second (SUV = 0.23 – 0.44 = -0.21) and Judge at first (SUV = 0.12 – 0.22 = -0.10). Therefore, without the error, Albers would have recorded an SUV = -0.16 – 0.21 – 0.10 = -0.47, bringing his total to 1.21 – 0.47 = 0.74. The error receives an SUV = 0.22 + 0.24 + 0.22 –(-0.47) = 1.15, which brings the cumulative unearned SUV now to 0.22 + 1.15 = 1.37. Headley next grounds into what would have been a force out at second, but instead is an error, allowing Sanchez to score (unearned SUV = 1 – 0.68 = 0.32), Judge to reach third (unearned SUV = 0.68 – 0.44 = 0.24), Gregorius to reach second (unearned SUV = 0.44 – 0.22 = 0.22), and Headley to reach first (unearned SUV = 0.22). Without the error, a second out (SUV = -0.16) would have been recorded, with Sanchez scoring (SUV = 1 – 0.68 = 0.32), Judge reaching third (SUV = 0.29 – 0.44 = -0.15), Gregorius erased (SUV = -0.22) and Headley reaching first (SUV = 0.12). The aggregate of this for Albers is -0.16 + 0.32 – 0.15 -0.22 + 0.12 = -0.09, bringing his total to 0.74 – 0.09 = 0.65. The cumulative unearned SUV now rises to 1.37 + 0.32 + 0.24 + 0.22 + 0.22 –(-0.09)= 2.46. Frazier strikes out for the second out (Albers' SUV = 0.29 – 0.68 = -0.39 for keeping Judge at third, plus 0.23 – 0.44 = -0.21 for doing likewise with Gregorius at second, plus 0.12 – 0.22 = -0.10 for keeping Headley at first, plus SUV = -0.16 for the second out). Albers' cumulative SUV is now 0.65 – 0.39 – 0.21 – 0.10 – 0.16 = -0.21. Next, Ellsbury doubles (Albers' SUV = 0.23), driving in Judge and Gregorius (Albers' SUV = 1 – 0.29 = 0.71 for Judge, plus 1 – 0.23 = 0.77 for Gregorius), and advancing Headley to third (Albers' SUV = 0.29 – 0.12 = 0.17). However, an error allows Headley to score (unearned SUV = 1 – 0.29 = 0.71) and Ellsbury to advance to third (unearned SUV = 0.29 – 0.23 = 0.06), neither of which would have occurred without the error. Totaling up Albers' SUV now yields -0.21 + 0.23 + 0.71 + 0.77 + 0.17 = 1.67. The unearned SUV now rises to 2.46 + 0.71 + 0.06 = 3.23. Torreyes next singles (Albers' SUV = 0.12), driving in Ellsbury from third (Albers' SUV = 1 – 0.29 = 0.71), raising Albers' cumulative SUV to 1.67 + 0.12 + 0.71 = 2.50. Finally, Hicks makes the third out (Albers' SUV = -0.12 for stranding Torreyes, plus -0.10 for the third out). Albers' cumulative SUV for this inning becomes 2.50 – 0.12 – 0.10 = 2.28. Adding this to the total unearned SUV = 3.23 yields 5.51, which corresponds to 6 – 0.49 = 5.51 for six runs scored in the inning.

Since Albers experienced no more errors over the remaining five innings he pitched, his total SUV acquired the generic -0.49 for each inning without a score and 1– 0.49 = 0.51 for each of the two innings where he yielded an additional run, bringing his total for the game to 2.28 + (3)(-0.49) + (2)(0.51) = 1.83. Seattle made no more errors, so the total unearned SUV for the game remains at

3.23. Reliever Altavilla yielded two runs in the seventh and none in the eighth for a cumulative SUV = 2.00 – 0.49 – 0.49 = 1.02. Thus, the total SUV for the two Seattle pitchers becomes 1.83 + 1.02 = 2.85 which, when combined with the unearned SUV = 3.23, equals 6.08, consistent with an eight-inning game SUV (Yankees were home) of 10 – (8)(0.49) = 6.08.

Seattle never scored again, so each of their remaining eight innings had SUVs = -0.49, with innings two, seven, eight and nine having the simplest "three up and three down" SUV = -0.23 – 0.16 – 0.10 = -0.49. Scoring only one run for the game, the total SUV is 1 – (9)(0.49) = -3.41, consistent with the total for all the players' SUVs (-4.25) plus the total unearned SUV (0.84), i.e., -4.25 + 0.84 = -3.41. The Yankees made an error in the sixth, so the SUV calculation for that inning went as follows: Cruz reaches first on an error (SUV = -0.23 for Cruz since he should have been out, with an unearned SUV = 0.39 –[-0.23] = 0.62); Seager strikes out for first out (SUV = 0.22 – 0.39 = -0.17 for leaving Cruz at first, plus -0.23 for making the first out, giving Seager a total of -0.40); Haniger strikes out for the second out (SUV = 0.12 – 0.22 = -0.10 for leaving Cruz at first, plus -0.16 for making the second out, giving Haniger a total of -0.26); finally Gamel makes out number three (SUV = -0.12 for stranding Cruz, plus -0.10 for the third out, giving Gamel a total of -0.22); total SUV for inning = 0.62 (unearned) – 0.23 – 0.40 – 0.26 – 0.22 = -0.49. The reader is left to calculate the SUVs for the other innings based on the play-by-play provided.

From this game, it is the Mariners' fourth inning that is of interest, with them having "batted around" to score seven runs. Zunino led off with a single (SUV = 0.39). Dyson was hit by a pitch (SUV = 0.39), advancing Zunino to second (SUV = 0.63 – 0.39 = 0.24), giving Dyson a total SUV of 0.63. Next, Heredia singled (SUV = 0.39), advancing each runner one base (SUV = 0.87 – 0.63 + 0.63 – 0.39 = 0.48), giving Heredia a total SUV of 0.87. Valencia followed with a double (SUV = 0.63), scoring all three runners (SUV = 3 – 0.87 – 0.63 – 0.39 = 1.11), giving Valencia a total SUV of 1.74. Cano singled (SUV = 0.39), advancing Valencia to third (SUV = 0.87 – 0.63 = 0.24), giving Cano a total SUV of 0.63. After a pitching change, Cruz singled (SUV = 0.39), scoring Valencia (SUV = 1 – 0.87 = 0.13) and advancing Cano to second (SUV = 0.63 – 0.39 = 0.24), giving Cruz a total SUV of 0.76. Powell came in to pinch run for Cruz; however, as he subsequently did not directly advance on his own or make an out on his own, he was not tracked in this inning (but tracked in later innings since he remained in the game and subsequently batted). Seager next scored everyone with a home run (SUV = 1 + 2 – 0.63 – 0.39 = 1.98). Finally, the next three batters made outs (Motter's SUV = -0.23, Gamel's SUV = -0.16, Zunino's SUV = -0.10). Since Zunino batted twice in the inning, he had two opportunities and a net SUV = 0.39 – 0.10 = 0.29. This is indicated by the bolded outline around his entry in the fourth inning. The Mariners' total SUV for the inning is the expected 7 – 0.49 = 6.51, as shown by the sum of the individual SUVs for the inning. Seattle's total game SUV = 12 – (8)(0.49) = 8.08 (Seattle was home), while the Twins' total was 3 – (9)(0.49) = -1.41.

Error/PB/CI											0.00	-1.31		4.09	-6.78

The interesting aspect of this final game is Toronto's walk-off victory in the bottom of the ninth. After the first two batters made outs (SUV = -0.23 – 0.16 = -0.39), Pillar homers to win the game (SUV = 1.00), giving Diaz an SUV = -0.39 + 1.00 = 0.61 for the inning, which exceeds the usual 1 – 0.49 = 0.51 typical for an inning with one run and three outs. Toronto's game total SUV is thus 3 – (9)(0.49) – 0.10 = -1.31 instead of the expected -1.41 because the final out, with an SUV = -0.10, never occurs. Seattle's run in the fifth is also of interest, since it involved an error. After Dyson made the first out (SUV = -0.23), Ruiz singled (SUV = 0.22), followed by Segura's double (SUV = 0.44), which advanced Ruiz to third (SUV = 0.68 – 0.22 = 0.46), who scored on an error (unearned SUV = 1 – 0.68 = 0.32), with Segura advancing to third on the same error (unearned SUV = 0.68 – 0.44 = 0.24). Therefore, Segura's total SUV = 0.44 + 0.46 = 0.90 and the total unearned SUV = 0.32 + 0.24 = 0.56. Gamel and Cruz made the next two outs without advancing Segura, for SUVs of 0.29 – 0.68 – 0.16 = -0.55 and -0.29 – 0.10 = -0.39, respectively. The inning's total SUV, with the unearned portion included, is the expected 1 – 0.49 = 0.51.
