

Is a Very Limited Supply Of Tokens A Good Or Bad Thing?

<https://regium.xyz>

What is it we remember from a basic economics course?
The price of an asset on the market is determined by supply and demand.

With growth in demand and reduction in supply, the price of the underlying asset begins growing steadily, while a reduction in demand and an increase in supply give rise to a rapid drop in the underlying asset's price.

It is also worth mentioning terms such as inflation, an excessive increase in the amount of paper money circulating in the country, which causes it to depreciate.

If we apply this term to crypto-economics, it will go like this; an excessive increase in the turnover of tokens on the market will inevitably lead to depreciation. Quite simply, the formula for success is, understandably, a low supply of coins with higher demand = higher price.

Case Studies on High and Low Supply:

Why is it that the price of gold is so high? It's a scarce commodity. Now, let's take a look at successful ICO projects that have a very low supply of tokens on the market.

Zcoin (XZC) began with 21 million Zcoins. They launched in September 2016 and employ the Zerocoin protocol for enabling private transactions. Let's see what happened to the price in the long-term:

With a good product, a strong team and a very limited supply, the price of XZC increased from \$0.36 in October 2016, to \$40.89 in December 2017, providing a great opportunity for investors to increase their investment 113 times in a little over a year. That is very outstanding growth indeed, and limited supply was one of the key factors behind this performance.

Skycoin is another good example. The project is designed to implement Satoshi's original vision, and also fix the problems with Bitcoin. Skycoin launched with a total of 25 million tokens in April 2017. The price started at \$0.83 per token, now it is trading at around \$15 per token, so we can observe a consistent growth in token value over the last eight months.

Market Cap	Volume (24h)	Circulating Supply	Total Supply	Max Supply
\$90 952 800 USD 7,777 BTC	\$372 307 USD 31.83 BTC	6,000,000 SKY	25,000,000 SKY	100,000,000 SKY

Of course, we are providing information about successful projects that have a low supply. They definitely have unique technology solutions and solid teams, but having a very limited supply is of utmost importance in pushing a token's value up over the long-term.

Let's look at projects that have a very high token supply; what do we see here? QASH and GXShare, the first with a total supply of 1 billion tokens, and the latter with a total supply of 100 million. In both scenarios the price fluctuates within a narrow range, without any hint of a strong uptrend. These ICO's problems could also be in the core idea, or the team's experience and professionalism, but the inflation factor can't be rejected.

What is Regium: REGI

First, let's look at what a REGI token is. It is a token that has a limited offer of 7,2 million tokens (one of the lowest supplies on the market). Every token is pre-mined. Investors purchase Regium tokens as a utility in order to follow the trading models that are provided by the Regium cryptocurrency Development team.

When buying regium at exchange the holders are recommended to take their tokens of exchange, sending them in to private wallet. By doing so the amount of available Regium will drastically decrease, and the value of investors Regium holdings will increase.

This is all economics classes 101. There is no need to reinvent the wheel, it's a well proven concept that have worked for thousands of years. Following the basic rules of mathematics and economics, will without a doubt result in an uptrend.

The more investors and traders that come on board, the higher the REGI token value goes up. These features will attract professional traders with experience in investment banks, hedge funds and prop-trading companies on Wall Street. Getting in early is key to make more than 20x gains out of your investment.

What Can We Conclude From This Article?

That with a very limited supply of REGI tokens, there is consistent growth in the project. Obviously, there is an advantage to buying large quantities of tokens in the early stages of development.

To get involved in a solid project, here are 3 simple steps:

1. To invest in Regi tokens you will need to purchase the Ethereum cryptocurrency. There are many methods for purchasing it, you should do your own research, because some methods will work in one country, but are unavailable in others.

2. To keep your Ethereum and purchased REGI tokens you will need a special wallet. We recommend <http://myetherwallet.com>, it's simple yet reliable.

3. Go to the Regium.xyz website. and find the buy and sell page where more information about markets and exchanges can be found
