

In this theory we will talk about the notion of masses masses are conceptually not understood so we will show how to understand masses now first of all masses have a relation with volume this relation defines how masses act the relation is simply is that if you have a mass having a certain volume you must now that this is not the true volume masses occupy less true volume than its seen volume being that said you know that if an element has a ratio of real volume over seen volume or  $\text{real volume/seen volume}$  in one element much less than that of another element you could conclude that the second element has larger mass
