

In a black hole and Hallucinations

Toshiro Takami

In a black hole, a collection of molecules that have been compressed to their extremes is evident to emit ultra-high heat.

The collection of molecules is compressed to the utmost limit and oscillates barely.

And hallucinations certainly exist. You can see it by reading my previous paper. I wrote the hallucinations in my previous paper.

In other words, we live next to another dimension.

Write again.

Hallucinations are from another dimension and exist. This can be understood by reading my previous paper. I wrote my hearing in detail in my previous paper.

We live side by side with another dimension.
