Abstract & General comments

First, $\pm\infty$ is constant at any observation point. If a set of real numbers is \mathbb{R} , then On the other hand, when $x (\in \mathbb{R})$ is taken on a number line, the absolute value X becomes larger toward $\pm\infty$ as the absolute value X is expanded. Similarly, as the size decreases, the absolute value X decreases toward 0. Furthermore, $x(-1)$ represents the reversal of the direction of the axis.

From “Reconstruction Proofs by Definition” of my No.67, I define all numbers as 5 numbers.

$$\boxed{-2} \quad \boxed{-1} \quad \boxed{0=2} \quad \boxed{1}$$
